

PasTools – Pressure & Deliverability Data Management

DATA STORAGE

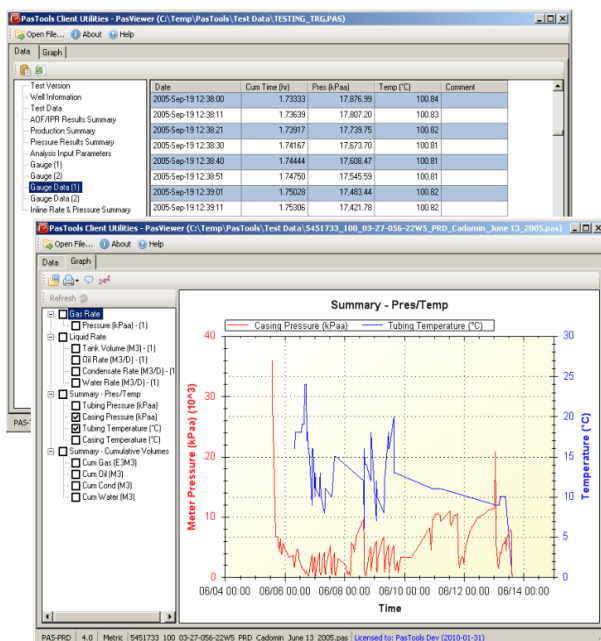

Database storage and access specifically designed for pressure and deliverability well test data. PasTools saves you from trying to squeeze pressure data into systems that never intended to capture detailed and specialized test information.

INTEGRATION

Painlessly import your test files directly into the well lifecycle system. The original PAS file is attached directly to the target well and links to relevant well entities are created.

VISUALIZATION

Analyze test data in a familiar tabular format while interactive graphing encourages deep analysis of data. Tests can be seamlessly accessed regardless of where they're physically located.

PasTools Helps You:

- Visually explore your pressure and deliverability data
- Safeguard your original test data files
- Integrate pressure data with all key systems
- Share pressure and deliverability data with the entire organization
- Increase your understanding of what's happening downhole

You've spent significant time and money collecting the best possible test data; now it's time to take advantage of this valuable asset. PasTools is a complete data management solution for your pressure and deliverability well test information. Powerful visualizations reveal otherwise difficult-to-see aspects of your pressure data, while our wizard-based integration provides a straightforward, step-by-step import into a data model specifically tailored for pressure and deliverability tests.

PasTools emphasizes important data and asset management tasks like integrating pressure and deliverability data into your well lifecycle, tracking and proactively completing regulatory test obligations, and providing managed global data access for the entire organization. We do this all using a very reasonable usage-based cost structure which means no long-term contracts or huge upfront development costs. Please contact us if you have any questions or to arrange a free demonstration.
